(57) ABSTRACT

A wash fluid and debris containment system includes a wash pad, a collecting trough, and a conveyor. The wash pad includes a support base and a top surface that rests on the support base. The top surface is configured to direct flow of wash fluid and debris to an edge of the top surface. The collecting trough extends along the edge to receive the wash fluid and debris from the top surface. The conveyor is positioned in at least a portion of the collecting trough and operable to remove the debris from an opposite end of the collecting trough from where the wash fluid is removed.
